# Object Oriented Programming Lab

FALL - 2022 LAB 04

# FAST National University of Computer and Emerging Sciences

# **Learning Outcomes**

In this lab you are expected to learn the following:

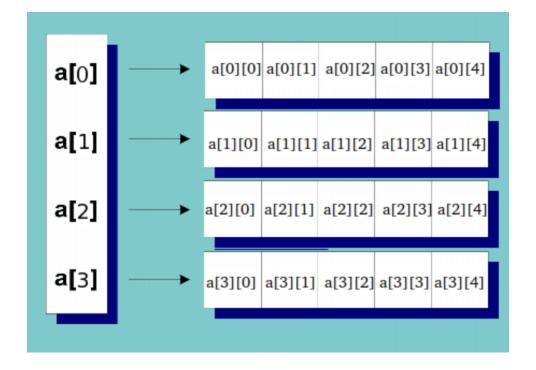

- 2D Dynamic Pointers
- Dynamic Memory Allocation
- ND Dynamic Pointers

# **2D Dynamic Pointers**

## 2D Pointers Declaration:

```
#include <iostream>
using namespace std;
int main()
{
   int rowCount = 4;
   int colCount = 5;
   int **a = new int *[rowCount];
   for (int i = 0; i < rowCount; ++i)
   {
      a[i] = new int[colCount];
      // OR
      *(a + i) = new int[colCount];
   }
   return 0;
}</pre>
```

The above, for colCount= 5 and rowCount = 4, would produce the following:

## 2D Pointers Declaration and Initialization:

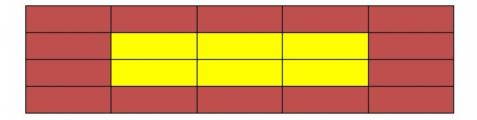

```
#include <iostream>
using namespace std;
int main()
       cout << endl;</pre>
```

## Lab Tasks

#### **Submission Instructions:**

- 1. Create a single cpp file containing all the functions of the problems and main function.
- 2. Save the **cpp** file with the task number **e.g. Q1.cpp**
- 3. Now create a new folder with name ROLLNO\_SEC\_LAB01 e.g. i22XXXX\_A\_LAB01
- 4. You need to display your roll no and name before the output of each question.
- 5. Move all of your .cpp files (without the main function i.e., comment out the main function) to this newly created directory and compress it into a .zip file.
- 6. Now you have to submit this zipped file on Google Classroom.
- 7. If you don't follow the above-mentioned submission instruction, you will be marked zero.
- 8. Plagiarism in the Lab Task will result in **zero** marks in the whole category.
- **Q 1.** Write a function that receives three arguments:
- (i) a 2D pointer p;
- (ii) number of rows;
- (iii) number of columns cols;

and return sum of the edges (boundary rows and columns which are shown as red area in the following figure) of the 2D array. Remember you have to calculate the sum of values at edges of the array shown as red area in the given figure only.

#### Prototype:

int calculateSum(int\*\* p, int rows, int cols)

- **Q 2.** Write a function to interchange the specified rows in the matrix. The function should receive the following arguments:
- (i) a 2D pointer p;
- (ii) number of rows;

- (iii) number of cols;
- (iv) the row numbers to be exchanged

And return the updated matrix with interchanged rows.

#### Prototype:

int\*\* interchangeRows(int\*\* p,int rows, int cols, int r1, int r2)

- **Q 3.** Write a function that receives the following arguments:
- (i) two 2D pointers;
- (ii) number of rows of both matrices;
- (iii) number of columns of both matrices

and return the product of both matrices.

#### Prototype:

int\*\* MatMul (int \*\* matrix1, int \*\* matrix2, int rowM1, int colM1, int rowM2, int colM2)

#### Q 4.

Declare and initialize a 3D dynamic array with the following size:

- (i) 3 Pages
- (ii) 4 Rows
- (iii) 5 Columns

And initialize it with the following elements using loops:

0	1	2	3	4
1	2	3	4	5
2	3	4	5	6
3	4	5	6	7
1	2	3	4	5
2	3	4	5	6
3	4	5	6	7
4	5	6	7	8
2	3	4	5	6
3	4	5	6	7
4	5	6	7	8
5	6	7	8	9

### **Prototype:**

int \*\*\*create3D(int pages, int rows, int cols)
